Integrated In-Room Perioperative Dashboard

SIS OR View is the first fully integrated in-room perioperative dashboard. The solution's dynamic display completely evolves the way perioperative teams work together by providing visual communication of pertinent case information for the entire OR care team. The configurable, wide screen display, improves communication by keeping clinicians, surgeons and anesthesiologists better informed with essential case information such as medical and surgical history, procedures, observations, staff in-room, lab and test results, milestones, checklists, time-out forms and patient allergies. Supporting the dynamic display of information improves communications and supports quality processes.

Many of the safety issues originating in the OR are founded in communication problems – something that SIS OR View is designed to reduce. The highly visual wide screen display configuration is easily viewed by the entire perioperative team and makes it easy to comply with surgical patient safety and pay-for-performance policies including those from: Joint Commission Universal Protocol, Joint Commission National Patient Safety Goals (NPSGs), Surgical Care Improvement Project (SCIP), Centers for Medicare & Medicaid Services (CMS), and World Health Organization (WHO).

SIS OR View promotes patient safety by enabling good teamwork and a high level of procedural awareness, and by mapping workflow documentation to quality hospital processes. Improved communication and the availability of information to the entire team facilitates quality processes with features like checklists that are designed to reduce serious errors such as wrong-site, wrong procedure and wrong person surgery.
