Medical I.D. Wristband

MEDICOM Technologies, Inc. introduces its revolutionary multimedia-enabled interactive Medical I.D. Wristband that readily presents an individual's complete medical history to emergency treatment personnel in critical situations. The first-of-its-kind, patent-pending MEDICOM Medical I.D. Wristband is an industry game changer, boasting an extraordinary array of audio, video and voice-driven health and entertainment features unsurpassed in today's marketplace in a stylish wristband design.

A boon for the 65 million Americans with chronic medical conditions requiring regular physicians' care, the computerized MEDICOM Medical I.D. Wristband is the first and only device with audio-visual capabilities that can store, display, edit, voice and transfer a patient's complete medical history in up to 9 languages to first responders, EMT's, and hospital personnel in any emergency medical situation. For non-emergency use in leisure time, consumers may also view photos or listen to songs, voice recordings, 20 FM radio stations, or watch movies via earphones that plug directly into the device.

With a touch of a button the wristband's graphic 1.5" LCD screen with digital display presents, in a scrolling fashion, comprehensive health data automatically pre-parsed into 14 intuitive files that may be individually selected, scrolled in either direction, and paused for easy viewing. The information can also be uploaded from the wristband to an ambulance lap top or hospital computer via a standard USB 2.0 cable connection.

Available in two trendy wristband options – stainless steel or black leather – the attractive fashion accessory design removes the stigma often associated with medical I.D. devices, thus encouraging more self-conscious and style-savvy

adolescents and adults with chronic pre-existing medical conditions to wear one and have it at-the-ready when an emergency presents.

In addition, other lower-tech medical I.D. products do provide patient information as readily, requiring emergency or hospital personnel to spend precious minutes calling an 800-number for basic medical history and instruction, with the secondary hope there are no problems with the I.D. number transfer, telephone connection, or the data access computer at that critical time.

How it works

From any Internet-enabled computer consumers may enter from 2GB to 8GB of vital medical, personal, and entertainment information via an intuitive Web site template, and then transfer the data to the MEDICOM Medical I.D. Wristband via a standard USB 2.0 cable/port connection.

The MEDICOM Medical I.D. Wristband will store and, at the touch of a button, instantly display a user's personal demographics; medical conditions; emergency contact information; all medications, dosages and times taken; advance directives and special treatment requests; x-ray disks and recent medical/lab results; medical/dental Insurance information; I.D. photo, allergies; physicians and pharmacy addresses and phone numbers; medical history including any diseases, surgeries, immunizations, etc.; as well as a miscellaneous folder to input medical appointments, notes, and virtually any additional medical information of note (charting & graphing, diet/exercise programs, Web favorites, etc).

Updates and edits to keep personal data current and accurate are also done at the push of a button. In addition, any medical data can be downloaded to the MEDICOM Medical I.D. Wristband from any physician's office, laboratory, medical or other relevant facility in the world via any Internet-enabled computer.
