

# Two Products Launched To Further Improve Flexibility In The OR

/PRNewswire/ -- MAQUET Surgical Workplaces has announced that it has launched two new products, TRIOP and VOLISTA, which are designed to improve the flexibility and performance of the operating theatre for hospitals and surgeons. TRIOP is a modular suspension system that offers versatility needed to organize a multi-disciplinary operating suite and VOLISTA, an extension of the TRIOP system, is the first modular surgical light designed to regulate the illumination reaching the surgeon's eye.

:"The development of the TRIOP suspension system and the VOLISTA surgical light is the result of our commitment to providing our customers with products that meet their evolving needs in the operating room," said Frédéric Herpin, Vice President, Marketing, MAQUET Surgical Workplaces. : "While the VOLISTA surgical light will provide a comfortable and accurate view of the patient for the surgeon, TRIOP will offer a revolutionary interface that gives the surgeon the ability to select from a full range of lightheads, display holders, cameras and other tools on a procedure-by-procedure basis."

TRIOP is a modular suspension system that utilizes the revolutionary Connect to Operate (C2OP) interface, which allows a full range of lightheads, display holders, cameras and other tools to be combined at will on a single suspension. The accessories are easily interchangeable, meaning that the needs of different medical specialities no longer have to be balanced against operating theatre occupancy criteria. Tools can now be pooled, ensuring that each surgeon has the ideal equipment for each operation.

The VOLISTA surgical light is an extension of the TRIOP system and incorporates MAQUET's innovative Luminance Management Device (LMD), a patent-pending system designed to regulate the illumination reaching the surgeon's eye. LMD provides surgeons a clear and accurate view of anatomical structures during surgery, visual comfort with minimal peripheral reflections and assures surgeons of equivalent light levels when they look at dark cavities or light tissue. VOLISTA is also very modular as it offers the surgeon the possibility to choose up to three color temperatures (3900, 4500 or 5100°K), thus adapting the illumination based on the surgery being performed.
