

Aspirating Speculum

The Markomanolakis Aspirating Speculum (K1-5155) combines the simplicity of a wire speculum with a large bore aspiration tube for efficient evacuation of excess fluids and particulate matter. The tube opening is positioned at the lateral canthus and can handle a large volume of fluid without the risk of occlusion by the conjunctiva. This new design allows for effective drainage of irrigating fluids during laser refractive surgery, maintaining an ocular surface free of microbial or chemical contaminants.
