

Orthopedic Surgery Navigation Systems

The Navitrack[®] Navigation combines Computer-Assisted Surgery technology and a surgeon's skill to help reduce joint misalignment and improve patients outcomes. It assists orthopedic surgeons during total hip and total knee replacement surgeries, nearly doubling their chances of attaining an almost perfect knee implant alignment. For some patients, surgery with the Navitrack Navigation System can also mean less tissue damage, a smaller scar, a quicker recovery, less pain and restoration of quality of life.
