

Rotating File Storage

The Rotary Storage System is a cost-effective, space efficient alternative to lateral and vertical files. The system consists of two back-to-back banks of files or shelving that rotate, delivering faster access and more than double capacity in the same amount of floor space. Virtually any type of material can be stored in the Rotary System, and as needs change, the system is easy to reconfigure. Available in a dozen different heights, both drawers and shelving are fully adjustable. Security options include the code-access TouchPad Release or the traditional mechanical foot pedal and key lock.
