

Video Intubation System

The DCI (direct coupler interface) Video Intubation System was developed to perform visually controlled airway intubations in virtually any medical or emergency setting. It provides the advantages of advanced technology while delivering remarkable image clarity. The system allows direct coupling of the imaging camera to the optical system of the endoscope. The DCI components will be available in flexible intubation fiberscopes, semi-rigid optical stylets, and the new video laryngoscopes. All components are interchangeable, providing efficient choices for difficult airway management, whether in the Operating Room, ICU, Obstetrics, NICU, or ER.
