

# Handheld Inventory Management System

The Pyxis ParAssist<sup>®</sup> handheld inventory management system helps manage inventory at remote supply locations by collecting data using handheld bar code scanners. This information is stored with data from other Pyxis<sup>®</sup> supply products, such as the Pyxis SupplyStation<sup>®</sup> secure inventory management system and the Pyxis JITrBUD<sup>®</sup> wireless open-access inventory management system, at the Pyxis SupplyCenter<sup>®</sup> console server. With information for all supply locations stored in one central repository, hospitals can increase inventory accuracy, refill efficiency and proactive management of par levels.
