

# Implantable Therapy System for Chronic Pain

The SynergyPlus+<sup>®</sup> implantable neurostimulation system for chronic pain is designed to give patients more control over the delivery of stimulation that blocks pain signals from reaching the brain while performing a variety of daily activities. The SynergyPlus+ offers up to 26 program options. Using a small, hand-held “remote control” programming device, patients can choose among multiple settings that are preset by a physician to address pain levels associated with different daily tasks, such as standing, walking or laying down.
