

Rotating Bipolar Forceps & Scissors

The multifunctional RoBi® Rotating Bipolar Forceps and Scissors are designed to allow one-handed operation by endoscopic surgeons to perform secure grasping, blunt dissection, and bipolar coagulation of tissue between the jaws. Optimal bipolar grasping is made possible by a robust hinge that has been incorporated into the wide-opening jaws of RoBi hand instruments. They also minimize lateral tissue damage and sticking of tissue during procedures. The fully rotational 360-degree sheath also enhances maneuverability during surgical use.
