

## Surgical Drainage Device

The SeroVac® is a minimally invasive disposable surgical drainage option for seroma/hematoma treatment. SeroVac introduces a soft, durable 14 gauge catheter, requiring only one access/puncture site for insertion and evacuation. The perforated indwelling design allows continuous drainage in a single procedure, avoiding multiple aspirations. Choices include length, regular or reflux-free assembly, blunt or sharp needle tip. SeroVac and SeroVac II are available with standard vacuum tubes and connectors. Axiom&reg's exclusive 150cc reservoir (available separately), is also recommended.
