

Major Surgical Light

The ALM X'TEN major surgical light is designed to provide optimal illumination performance for a wide range of surgeries in a unique, compact design. The light incorporates a proprietary cross-shaped lighthead ideal for laminar flow, and it is easy to position. Patented dichroic mirror and micro-lens technology deliver thousands of diverging light beams to create a homogeneous distribution of light and efficient heat management over the entire surgical site. In addition, optimal color temperature, combined with a color-rendering index (CRI) of 93, help provide true tissue color representation. The X'TEN system provides 110,000 Lux of illumination over an adjustable 10/12-inch light patch diameter.
