

Electronic Lock for Procedure Carts

High-traffic healthcare environments will benefit from the extra security provided by this electronic keyless entry lock system. Developed for Procedure Carts and C-Lockers, the lock eliminates the difficult management of keys while protecting vital contents from unauthorized entry. Up to 89 user codes and 11 supervisor codes can be assigned to those who require access. The lock automatically activates when placed in the closed position and an open-cart alarm sounds if the cart is not secured within a set period of time. The device is powered by AA batteries and includes a key override.
