

Durable Barcode Labels

Designed to meet the growing demand for long-term traceability, the new range of data matrix and 2D barcode labels from CILS offers a convenient and reliable way of including highly durable information on samples and specimens. Able to withstand temperatures from cryogenic storage to autoclave sterilization, the new range of labels have a special surface coating that offers superior print quality for first-time reading, allied with enhanced resistance to chemicals, solvents and handling. Using Thermal Transfer printing and ECC200 coding, a 4-mm x 4-mm Data Matrix symbol can hold up to 15 characters worth of information and, due to the design of the encoding, can still be read with up to 60 percent physical damage.
