

Patient Temperature Management Pads

Kimberly-Clark has introduced two universal thermal pads that enable rapid application of temperature management and greater flexibility in pad placement on patients. These small- or large-sized rectangular pads are designed to be placed anywhere on the body where there is intact, well-perfused skin. Kimberly-Clark Patient Warming System provides an efficient, non-invasive method of temperature control, requiring minimal body coverage for maximum access to surgical sites. The system is the ideal thermal management solution for complex surgeries involving access to large surface areas or open cavities, such as cardiovascular, trauma, orthopedic or lipoplasty.
