Videolaparoscope

The autoclavable HD EndoEYE videolaparoscope features a 10-mm outside diameter and a working length of 390 mm, making it ideal for use on even the largest patients. Offering a 30 degree and 45 degree direction of view, the HD EndoEYE utilizes proprietary distal tip technology to provide optimal image quality with increased durability compared to traditional rod lens systems that transfer the image through multiple interfaces. The distal chip provides focus free convenience with reduced fogging and produces 1080 lines of resolution for a crisp, clear image with accurate color reproduction.
