

Arthroscopy Procedure Kits

The DYONICS® ARTHROPAK® Customized Procedure Kits contain medical devices used in the most common arthroscopic procedures. The kits are designed to increase operational efficiencies and lower overall costs by helping to reduce the amount of time facility staff spend ordering and pulling supplies, such as cannulae, sterile tubing and arthroscopic resection blades for each procedure. Instead, the surgery center staff simply designates which supplies and devices the kits should contain. Each kit has its own SKU (product identifier) so when the time comes to replenish supplies, the purchasing staff can easily order a new kit instead of individual devices. They can also have a standing order to replenish supplies.
