Spinal Surgery Table Attachment

The Allen® Spinal System attaches to existing OR tables, providing an advanced spinal surgery platform for a fraction of the cost of a standard spinal table. The system's carbon fiber frame provides unhindered C-Arm access, while the Wing Sets and C-Prone Head Positioner help to manage skin pressure and adjust for a customized fit for each patient. Power from the table allows controlled intraoperative repositioning of the patient from kyphosis to lordosis in seconds. The frame tilts up to 20 degrees for improved site access. Set-up is simple, with the system locking securely into place in three easy steps. An integral cart allows for easy transportation and the entire system stores in two square feet.
