

Surgical Mesh

Booth # 2142 PIVIT surgical mesh with a bioresorbable, polymer coating delivers lower mass, enlarged pore size and greater elasticity which can result in significantly less scar tissue than many meshes currently in use. Its superior handling characteristics facilitate precise placement during surgery, leaving less implant material following bioresorption of the polymer coating. PIVIT AB, now available, combines the standard characteristics of the PIVIT mesh with antimicrobial agents (rifampin and minocycline) to help prevent microbial colonization of the mesh during surgical implantation.
