In-Line Suction Filter

The ALL Day In-line Filter is rated for multiple procedures so it can be used throughout the entire day. Manufactured with ULPA filtration media rated 99.9995% efficient at 0.1 micron, this filter easily connects with wall suction to filter airborne particulate created from tissue ablation during electrosurgical and laser procedures. It is made with transparent plastic so users can visually monitor the filter's color change during usage to gauge filter life.
