

Low-Voltage Tissue Treatment System

The PK#153 Technology platform allows surgeons to perform a wide range of tissue treatment procedures with maximum precision and safety. The system provides low-voltage RF energy to resect rapidly at low temperatures and with minimal thermal spread, virtually eliminating charring. It also combines the safety of saline with “seal-as-you-cut” tissue resection and vaporization for treatment of BPH and bladder tumors. The PK Technology platform powers a variety of devices that cut, coagulate and seal to minimize blood loss and shorten procedure times. It is ideal for daycase or outpatient TURP procedures.
