

Retractor Ring for Vaginal Surgery

The surgeon-developed 3715 Anterior/Posterior/Sling (APS) Retractor Ring is specifically designed for Posterior Intravaginal Slingplasty (PIVS) procedures as well as other vaginal surgeries. The open end design of ring provides unobstructed access and use of surgical instruments for optimal visual exposure during surgeries. The 3715 APS features closely positioned slots for precise placement of stays and custom-engineered holes (two on each side) for non-perforating towel clamps to stabilize the retractor ring. The ring also includes two catheter clips to manage a Foley catheter, providing optimum organization of the surgery site.
