

Patient Skin Prep

The ChloraPrep® patient preoperative skin preparation line has been expanded to include the new Hi-Lite Orange™ tinted applicators. The tint gives the surgical team assurance that the site has been prepped, while still allowing visualization of the skin. The new ChloraPrep tint is available in 3-mL, 10.5-mL and 26-mL applicator sizes. ChloraPrep, including the new tinted product, is a 2 percent chlorhexidine gluconate and 70 percent isopropyl alcohol one-step skin prep. It delivers precise volumes of tinted ChloraPrep solution in a unique applicator that keeps the hands away from the procedural site and also provides a gentle friction scrub to help penetrate deeper into the dermal layers.
