## High-Definition Video Recorder

The PDW-70MD XDCAM HD is an optical HD recorder designed to capture and store high-definition video of medical procedures in 1440 x 1080i resolution. The device can record and store up to two hours on a 23 GB PFD-23 XDCAM<sup>®</sup> disc, which is sealed to help prevent scratches and preserve data with minimal degradation for more than 50 years. The recorder integrates a 3.5-inch color LCD screen that allows users to view thumbnail-sized stills of footage accessible through random access memory. This enables users to quickly identify points of interest without manually winding through hours of footage.
