

Cross Connector System for Spinal Fusion Surgery

The EXPEDIUM[®] SFX[®] Cross Connector System, the latest enhancement to the EXPEDIUM Spine System, is designed to make cross connector implantation quicker, easier and more secure at the completion of spinal fusion surgery. This cross connector system offers a unique “snap-fit” feature that provides surgeons audible and tactile feedback that confirms the connector is securely attached to the rod. Its top-loading design reduces operative time compared with existing cross connectors that require implantation at an angle. EXPEDIUM SFX offers a wide range of implant options and is available in fixed or adjustable length configurations, including a low-profile option. It also has increased dural and graft site clearance for the low thoracic and lumbar regions.
