# Image & Video Capture System

The iCap Image and Video Capture System for Windows XP is offered in two configurations: One is a turnkey system, a medical grade computer system that includes the computer hardware and software pre-configured. The other option is a software solution with a USB digital capture unit that can plug into an existing computer system. With iCap, surgeons can capture still images and video clips, then easily annotate images and catalog them by an identity for easy review later. The systems can send images directly to report templates in Microsoft Word and allows images to be easily integrated into Power Point presentations and e-mail applications. And, as the system is Windows-based, it offers the user the ability to easily network multiple capture stations together with a server to create an image archival network. The images and reports are standard image files and office documents that can easily be shared via email, FTP, and easily linked to most Electronic Medical Record systems.
