

Procedure Gowns

FluidGard® Procedure Gowns are designed to provide comfort as well as protection. The gowns are made from SMS, a multi-layer material composed of varying layers of spunbonded and meltblown polypropylene. SMS is a breathable fabric with a high tensile strength that makes it difficult to rip or puncture. These procedure gowns are designed for use when exposure to light or moderate fluid contact is expected. They have knit cuffs, full backs and are available in yellow, blue or white. The gowns are also available in universal or x-large sizes.
