

Topical Skin-Closure Adhesive

INDERMIL® Tissue Adhesive for the closure of topical skin incisions and lacerations allows surgeons to close wounds and incisions with a ready-to-use and precise single-application product, offering significant improvements in wound closure times compared with current methods. Unlike other closure options such as non-absorbable sutures or staples, which must be removed, INDERMIL gradually sheds from the wound in seven to ten days when no longer required. INDERMIL also offers other unique advantages, including a non-clogging applicator tip that does not need to come into direct contact with the wound surface during application, thus reducing the potential to disrupt wound edges during use.
