

Toric Lens Manipulator

The Lu Irrigating Toric Lens Manipulator (K7-5780) safely manipulates and rotates a Toric lens into position while maintaining the chamber. It features a slightly recessed bulbous shaped tip at the end of a 20 gauge thin wall irrigation tube. The final alignment is accomplished with the Irrigating Lens Manipulator as it maintains the anterior chamber, avoids damaging the posterior capsule and safely rotates the lens around by the haptic. Manipulation with existing instruments runs the risk of a flat anterior chamber and/or leaving marks on the surface of the hydrophobic lens material.
