

Post-Op Abdominal Binder

The Dale® Abdominal Binder is an adjustable post-operative support made from a stretch material that evenly distributes compression to brace abdominal muscles, encourage mobility, and promote muscle redevelopment. Featuring paneled construction which prevents riding, roping and folding over, this support encourages activity, facilitates diaphragmatic breathing and splints the wound for coughing. Designed to move with the patient and increase their activity to decrease post-op complications such as atelectasis and pneumonia, the support is made from a latex-free, all-elastic material which permits total circumferential compression and uses Velcro® to engage anywhere along the binder. This abdominal binder is 15 inches wide and stretches up to 94 inches.
