

Surgical Light Systems

The Stryker Visum[®] Surgical Light Systems provide an ideal combination of brightness, maneuverability and shadow resolution. With superb illuminating intensity from each lighthead, these lights are engineered to provide brilliant white light without sacrificing color accuracy. When positioned at the ideal distance from the surgical field, the Stryker Visum 600 provides a 28-inch solid column of light, which means that the light should not have to be adjusted during surgery. Additionally, an automatic reserve bulb in each light provides maximum safety during procedures. All Stryker Visum light systems come standard with five pole commutators at each 360 degree rotational point to allow for a cleaner data and video signal transmission.
