

Portable ECG Monitor

The portable Sonoplus[®] 3000-DS three lead ECG monitor is a pocket-sized device that provides the clinician with the ability to listen to heart sounds and see real-time cardiac tracings at the same time. The ECG tracings can be stored to memory for later recall or downloaded to a PC. The monitor can be detached from the stethoscope tubing allowing the clinician to have immediate access to the ECG monitor. The gold plated contact leads are built into the Sonoplus, so no attachment leads are needed during the screening process, though they are available for ongoing monitoring.
