

Osteotome-Style Bone Cement Tool

The Valitome[®] is designed with an osteotome-style beveled tip. Its narrow profile allows the surgeon to get into hard-to reach places while the sharp, straight edge makes it easier to apply cement evenly for better adherence and remove excess cement completely and safely from flat surfaces. Its ergonomic shape, with molded-in thumb indentation, instantly orients the tip of the tool facilitating precise movements. Made of high strength medical-grade plastic, the Valitome minimizes the chances of scratching the prosthesis and as it arrives sterile, individually packaged and is disposable; it saves valuable time in the OR.
