

Surgical Incision Closure Device

The INSORB® Single User Forceps is a proprietary medical device that allows a single clinician to close a surgical incision with the INSORB Subcuticular Skin Stapler entirely by themselves. The reusable INSORB Forceps is a single forceps with two arms and a center member with a bridge to 'dock' with the INSORB Subcuticular Skin Stapler. The INSORB Subcuticular Skin Stapler represents an innovative skin closure modality designed to combine the cosmesis of absorbable suture with the rapid closure times associated with metal skin staplers, while eliminating the need for metal staple removal post-operatively.
