

Autoclave & Sterilization Resistant Labels

The CIL 9000 range of laboratory labels is designed for wet, dry and radiation sterilization processes and are resistant to autoclaves, chemicals, detergents, washing and temperature extremes of up to 400 C. The labels are ideal for identifying lab ware, theatre instrument trays, microsurgical and medical devices, double blister packs and more. CILS manufactures the widest range of labels that can be supplied pre-printed or blank in any size, shape and color to your specification. Printed variable data such as lot, batch and serial numbers, as well as 2-dimensional barcodes can be added 'in-house' with a thermal transfer or laser printer. CILS also has a bureau service to print barcodes and number sequences onto labels as desired.
