Lighted Suction Device

The new generation of the VersaLight® single-use surgical device is five times brighter, as well as cooler, stronger and less costly, than its chief competitors. The new offering features improved suction, a new cable management system, and uniform, cool, shadowless light. Extra relief holes in the new VersaLight increase suction effectiveness and allow surgeons to wipe the tissue dry while preventing tissue grab. Using existing OR light sources, this device has a more uniform spot light, which improves visualization in deep cavity surgery, helping minimize blood loss and optimize navigation. The VersaLight's 4-in-1 design brings suction, irrigation, retraction and light to the surgical site.
