

## Suture Anchor for Hip & Shoulder Repair

The BIORAPTOR 2.3 PK Suture Anchor is intended for repair of instability in the hip or shoulder joint. It is designed to be implanted in the dense bone along the rim of the joint socket. Its small size and design provide strong fixation and allow a surgeon to use more than one to establish multiple attachment points, creating a uniform bumper and stabilizing the joint. The BIORAPTOR 2.3 PK anchor comes with a delivery system that enables surgeons to place it through a portal, or percutaneously.
