

Bacteriostatic Treatment for Tissue Trauma

Booth # 528 Humatrix[®] Microclysmic gel is a bacteriostatic, protein based gel that modulates the osmotic pressure of tissue by the timed release of moisture. This gel promotes and accelerates cellular regeneration by replicating the natural fibro-connective template and promoting fibroblast activity. Designed for treating tissue trauma, this new technology modifies the endothermic properties of the tissue to reduce surface temperature by 10 to 15 degrees in the first 5 minutes after application, thereby relieving pain.
