

## Detachable IV Transport System

The Detachable ICU IV Transport Skyboom permits the safe and speedy transport of patients with multiple IV pumps on and off the ICU floor. The Ergon IV Transport Skyboom provides greater efficiency for care within the patient's room as well as for the transport process, requiring fewer staff members to complete the transport process. The detachable IV transport system easily adapts to patient beds as well as the boom with a patented transfer system that takes the work out of moving IV pumps from bed to boom and back again. IV lines and pumps can be managed from one location and still permit convenient and uncluttered mobility through doorways, down the hallway, or on and off elevators.
