

Equipment Management Systems

TRUMPF Equipment Management Systems for the OR and Critical Care environments include single and tandem arm solutions, as well as innovations such as the TRUMPF Vertical Articulating arm, capable of lifting anesthesia machines weighing up to 400pounds. Working together with each facility's architects, equipment planners and medical staff, TRUMPF engineers identify the hospital's specific needs and requirements to develop solutions to meet virtually any need or discipline. This cooperative dynamic yields ongoing innovations that benefit each subsequent customer. The custom design and installation of each TRUMPF Equipment Management System ensures 350 degrees of movement with tandem arms able to freely pass each other. All this allows OR setup to be optimized easily from procedure to procedure.
