Clinical Supply Management System

The System 100™ clinical supply management system uses embedded Radio Frequency Identification (RFID) technology and biometric security access to reliably and accurately track and account for high cost clinical supplies in real time. This innovative solution helps hopitals to maximize charge capture, reduce costs associated with expired items, optimize inventory, meet compliance mandates and ultimately provide improved patient care. Implementing System 100 is as easy as rolling the intelligent cart in-place, plugging in the power cord and network connection (for internet access), applying RFID tags and placing high cost clinical devices in the cart. The entire process is accomplished in less than a day. There are no buttons to push or additional processes to follow, so staff compliance is not an issue.
