

Digital Mapping Technology For Instrument Repair

Spectra-Scan™ is the first digital mapping technology designed specifically for instrument repair. The digital microscope records images for “before and after” repair documentation. It also locates and records micro cracks, missing teeth, pitting and the presence of bioburden. This technology can magnify 250 times allowing photographic images to be cataloged for liability prevention or printed out for departmental training. Repair images can be cataloged on CD or e-mailed for documentation purposes. This exclusive technology is available to Spectrum Surgical customers through the company’s “on-location” repair labs or its National Repair Center.
