

Surgical Lighting & Visualization System

The Harmony® LED Surgical Lighting System provides 160,000 lux of pure, white light and generates significantly less heat than traditional incandescent lights. Eighty-four precision fitted LEDs provide excellent shadow control and an industry-leading color rendering index of 97, giving surgeons better tissue differentiation, even deep in the pelvis. The lighting system is also designed to provide detailed and precise diagnostic images with a high definition suspension that assures razor sharp high-definition images on its surgical-grade flat panel monitors. In addition, the Harmony LED system is future-ready, designed to accommodate all the current integration vendors as well as anticipated future signal media.
