

Wahsable Medical-Grade Keyboard

The J84-2800 Series washable keyboards help control the spread of infections in medical facilities. The keyboard features a fully-sealed rubber casing rated to NEMA 4. This makes it suitable for rinsing and total immersion in cleaning fluids, allowing healthcare providers and other users to wash the keyboard with hospital-grade disinfectants and commercial anti-bacterial wipes. It is suitable for areas with strict hygiene demands, such as operating rooms, medical carts, ward stations, intensive care units and dialysis centers, as well as other locations susceptible to cross-contamination. The J84-2800 features a "CLEAN" key that disables key functions during the cleaning process to prevent accidental data transfer and ensure infection control procedures can be carried out without disruption to patient care or costly downtime to system hardware.
