

Automated Breast Volume Scanner

The ACUSON S2000[®] ABVS Automated Breast Volume Scanner streamlines workflow and reduces operator dependence and variability by quickly and comfortably surveying and acquiring full-field sonographic volumes for comprehensive review and diagnosis of the breast. The system offers an innovative, mobile in-suite design combining the advanced ACUSON S2000[®] ultrasound system and a column stand with a transducer specifically designed for automated ultrasound breast imaging. One single scan produces a breast volume comprised of many single images, which are sent to a dedicated ABVS Workplace for analysis and manipulation. The ACUSON S2000 ABVS system is 510 (k) pending and not yet commercially available in the United States.
