

Security Labels

Computer Imprintable Label Systems (CILS) has launched a security label specifically developed to survive -80°C and maintain sample security. The new CILS 8200V/HT label, developed for the Medical/Laboratory Industry, provides instant and clear indication that samples have been tampered with by displaying a 'VOID' pattern if the label is removed. This material provides instant security with no adhesive curing time. CILS Security Labels are manufactured and pre-printed to exact specification from their vast range of durable materials and adhesives. Variable data can be printed in-house using an existing PC and Laser or Thermal Transfer printer, or using the CILS Barcode/Variable Data Bureau printing service.
