

Orthopedic Extension for Surgical Tables

The Cmax/3085 SP/3080 Orthopedic Extension can increase the variety of surgical procedures performed on general surgery tables, including supine or lateral lower extremity procedures requiring boot or skeletal traction. The new Tensor Carbon Fiber Traction Unit allows precise, smooth adjustment of traction and uses a quick-coupling feature to attach boots or blocks easily. The radiolucent carbon fiber abductor bars allow unobstructed imaging and easy lower extremity positioning according to patient size and treatment needs. The companion accessory cart allows ergonomic transfer and storage of accessories. The Orthopedic Extension is the ideal solution when current or anticipated caseload does not warrant a dedicated orthopedic table, or when a cost-effective supplemental fracture table is needed.
