

Argon Plasma Cut/Coag System

The ERBE VIO®/APC 2 System offers precise dosing of power output, high safety standards and maximum control. The system uses as much power as needed, but as little as possible, every millisecond. Both the CUT and COAG modes "self-adjust" to circuit impedance variables, minimizing thermal insult and reducing charring or sticking. The ERBE VIO/APC 2 is equipped with PRECISE APC®, which adjusts the argon plasma automatically regardless of the impedance of the overall system and can be upgraded to include BiClamp® thermal vessel fusion technology to create an all-in-one workstation. The VIO/APC 2 is also compatible with the new ERBEJET® 2 system which allows non-thermal organ dissection, as well as gastrointestinal endoscopic needle-less lesion elevation and resection.
