

Tissue Reinforcement Matrix

The GORE BIO-A Tissue Reinforcement, a synthetic matrix material that encourages tissue generation in soft tissue reinforcement applications, is now available in a new configuration for hiatal hernia repair. The new configuration is custom shaped with a thinner design to provide surgeons a superior solution for the unique challenges faced in hiatal hernia repair. GORE BIO-A Tissue Reinforcement is a uniquely designed web of biocompatible synthetic polymers that is gradually absorbed by the body, while its 3D matrix of open, highly interconnected pores serves as a scaffold for tissue generation.
