

## Abdominal Wound Closure System

The ABRA Abdominal Wall Closure System is part of the line of Canica Dynamic Wound Closure Systems, which allows users to control domain and achieve delayed primary closure of retracted wounds in normal and Bariatric patients. The ABRA System provides surgical dynamic reduction for full thickness, severely retracted abdominal defects. This method uses button anchors and elastomers to gradually pull the wound margins together. Tension can be set and adjusted according to the desired outcome. ABRA is used to stabilize a retracted wound, reduce the wound, close the wound or prevent wound dehiscence. With ABRA, there is no need to patch with skin grafts or mesh.
